Texas Instruments

Product Bulletin

**Klixon**

**PTC Motor Starters**

**8EA Series**

---

**Features**

- Solid-state PTC motor starter
- Designed for use with most split phase, capacitor run and/or start, fractional h.p. hermetic compressors
- Available for all single phase voltage applications
- Low power dissipation
- Easy installation
- Electrically (EMI) noise free
- Operating noise free
- Approved for use with explosive proof applications
- High reliability with no moving parts

---

**Product Overview**

The Texas Instruments 8EA motor starter, a low-cost alternative to electro-mechanical relays, performs the PTC (positive temperature coefficient) solid-state starter function. The 8EA is suitable for compressors used in refrigerators, freezers, water coolers, de-humidifiers, vending machines and similar refrigeration applications. It plugs directly onto the compressor terminal pins, and is frequently used with the TI 4TM plug-on motor protector.

**Technical Features**

- Utilizes PTC pill materials to energize / de-energize motor start windings
- Provides inherent start winding protection
- Optimal packaging approach improves efficiency
- Used in 120V or 240V applications
- Provides lowest power consumption in industry
- Wide spectrum of resistance ranges available

---

**Quality and Performance**

- PTC pills 100% electrically tested twice
- High reliability with no moving parts
- 500K cycles min. at max. rated condition
- Dissipates less than 2 watts under normal operating conditions
- UL and CUL Recognized Component: File SA3745
- IEC Cert. number: US/4312/UL
- Demko Cert. number: 129508-1
- CCEE number: CH003840-99
- ENEC 2018218.01

---

**Convenience**

- Fits within most existing terminal fences
- Highly legible part coding
- One rating will potentially service entire compressor voltage series
- Mounts directly to the compressor terminal pins
- Compatible with world class TI 4TM motor protection

---

**Exploded View**

**Assembly Process Description**

The illustration above depicts the assembly of the 8EA onto the compressor. The 4TM motor protector is plugged onto the common pin. The 8EA plugs onto the remaining 2 pins. Female flag connectors are connected, and the electrical cover encloses the entire assembly.

**8EA Coding System**

8EA XXX .............. TI product number

XXXX ................... Customer part number optional

06H9R .................. Date Code (Typical)

M exco .................. Country of Origin (Typical)

---

**Dimensional Drawings (mm)**
When power is first applied to the compressor via the 8EA, the PTC pill is in low resistance state. Current flows through the PTC pill to the start windings, causing a beneficial phase angle shift between start and main windings, and resulting in an increase in the starting torque.

**PTC Performance**

General trends are shown for changes in the PTCR element specifications and the corresponding 8EA device properties.

8EA PTC Motor Starter Application Procedure

Step 1: Assemble Data Required for New Applications

- Example

R₀ Resistance .............................. 5.0 Ohms
Max. Volt (Vᵢₘₐₓ) ............................ 162 VAC
Max. Current (In Rush) .............. 8 Amp
Switch Time of Motor ................. >0.5 Sec @ 8 Amp
Motor Type ............................... RSCR
Reset Time ............................... <80 Sec @ Nom. Volt
Test Requirements .................... 250K Cycles @ Max.

Step 2: Select PTC pill based on resistance and maximum operating conditions. (See electrical rating on previous page).

Step 3: Select 8EA physical configuration based on motor type. (See terminal configurations on previous page).

Step 4: Switch Time Calculation

The amount of time required for PTC to switch into its high resistance state can be approximated as follows:

\[ \text{Time (Sec)} = \frac{\mu C_F (T_S - T_A)}{I^2 R} \]

\( \mu C_F = \text{Heat Capacity (Watt-Sec/°C)} \)
\( T_S = \text{Switch Temperature (°C)} \)
\( T_A = \text{Ambient Temperature(°C)} \)
\( I = \text{Inrush Current (Amps-Rms)} \)
\( R = \text{Initial Device Resistance Under Voltage (Use } R_0 \times 0.8) \)

Example

\( R = 5 \text{ Ohms (} R = 5 \times 0.8 = 4) \)
\( I = 8 \text{ Amps} \)
\( T_S = 1200°C \)
\( T_A = 250°C \)
\( \mu C_F = 1.60 \)

\[ \text{Time (Sec)} = (8^2) (4) \]
\[ \text{Switch Time} = 0.59 \text{ Sec.} \]

Theoretical Calculated PTC Switch Time Should Be ≥ Time Required to Start Motor

Glossary

- R₀: Measured resistance value at 25°C Max. voltage of 2.0 volts.
- Cooldown Time: Time required for the PTC resistance to return to two times the initial value (2 R₀)
- Curie Point (Switch Temp.): Temperature obtained with a resistance value of two times (2R₀) the minimum resistance value (R₀)
- Vᵢₘₐₓ: Maximum operating voltage which may be applied across the PTC continuously at the ambient temperature specified and in a steady high resistance state.
- Vᵣ: Application rated supplied voltage/ 120 or 240 VAC (below Vᵢₘₐₓ)
- Iₛₛ: Steady state current remaining at maximum operating voltage.
- Iₘₐₓ: Maximum operating current.

Application Notes

1. The surface and terminals of the 8EA device can reach high temperatures under normal running conditions. Any material in contact with the 8EA device, including wire and quick-connect receptacle plastic insulation, should have a minimum temperature rating (RTI) of 105°C. Adequate spacing should be provided to insulate lower-rated materials from this heat source.

2. The 8EA device should be protected from potential sources of liquid, such as the evaporator tray and water connections.

3. Certain materials, such as chlorine (Cl) containing gases, can degrade the characteristics of the 8EA device. The 8EA device should not be exposed to sulphur (S) or chlorine (Cl) containing gases, and must be kept away from materials that can generate them. In particular, avoid the use of polyvinyl chloride (PVC) insulation in contact with the 8EA terminals.

4. The 8EA device is designed to be used in conjunction with an electrical cover.
